Electrical equipment and devices are vital in all electrical installation so as to ensure continuity and efficient operations. Equipment like transformers, motors, variable frequency drives, uninterruptible power supplies and batteries are today’s common components in most electrical installations.
INTRODUCTION

Safe operations are essential as they are protected by modern and sophisticated relays and protection devices.

Protection systems are installed to prevent faults from damaging electrical plant and to initiate isolation of faulted sections in order to maintain continuity of supply elsewhere on the system. Recent changes in technology together with changes in the manner in which Utilities and Industrial organisations operate, has greatly emphasized the development of integrated protection and control.

This seminar will highlight:

- The construction and operations of transformers and motors
- The characteristics of variable speed drives
- The importance and role of UPS and batteries
- The types of maintenance
- The functionalities of protection relays

OBJECTIVES

At the end of this seminar, you will learn to:

- Describe the various types of transformer and motors
- Appreciate the importance of uninterruptible power supply and batteries
- Analyse the various transformer tests
- Explain the operation of the various types of testing instruments
- Recognise the symbols in electrical drawings
ORGANISATIONAL IMPACT

On successful completion the organizational impact would be able to:

✓ Developed a structured approach and understanding of the major electrical equipment installed
✓ Appreciation of the workforce in handling the troubleshooting, maintenance and repair of electrical equipment
✓ Correct handling of testing and measuring instruments
